

THE SAPIENT COMPANY

Superhuman Intelligence

The cognition protocol for machines: a real-time, in-silico read of how a human brain responds to anything a machine says or shows.

Pre-seed • \$2M at \$20M

Mary • Qualia • neurosignal

thesapiencompany.com

01 — THE FUTURE

Every machine is about to need a nervous system for the humans it talks to.

Assistants, agents, companions, ad platforms, robots — every one of these needs to understand the human on the other side in real time. None of them can yet. They read what you typed. They do not read you.

Frontier AI assistants

Advertising & creative testing

AI safety & interpretability

Consumer robotics

Digital therapeutics

02 – THE PROBLEM

Intelligence reads your words. It does not read you.

Every model in production today infers intent from text, clicks, and self-report. None of it touches the actual signal underneath a decision: what a person's brain is doing while they watch, listen, or read.

Attention

Emotion

Reward & value

Decision conflict

Memory

03 — WHAT WE'RE BUILDING

A real-time read of attention, emotion, reward, decision conflict, and memory for every human a machine interacts with.

INPUT

Any stimulus

Video, audio, copy, a whole campaign, a conversation turn.

MARY

Predicted cortex

Sapient-1 maps the stimulus to whole-cortex fMRI activation, second by second.

QUALIA · NEURO SIGNAL

Decision signal

Attention, emotion, reward/value, decision conflict, memory — plus a calibrated buy/sell read.

04 — TRACTION

Live product, real usage.

Verdict, Scan, and Mary are shipped and in market today.

37K+ Waitlist signups	10M+ Views generated
5K+ Scans run	1,265 Organizations

One model, three markets that all need the same thing.

LIVE TODAY

Brand & creative intelligence

Verdict, Scan, and Mary predict how an audience's brain and behavior respond to creative before it ships — attention, resonance, and a calibrated buy/sell signal.

ACTIVE PILOT

AI safety & interpretability

A human-effect axis for frontier model evaluation: calibrated manipulation and sycophancy indices that flag when a system is steering a person through affect or reward while suppressing analytic engagement.

ROADMAP

Personalized AI & the clinic

The same per-subject encoder that beats the average-brain model out of sample is the substrate for AI that is tuned to one mind, not the crowd.

Usage-based today. Licensing tomorrow.

Infrastructure-first, pay-as-you-go pricing: the API is the product, the app is a free demo.

FREE \$0 3 web scans + \$5/mo API credit	PRO \$149/mo Higher usage, priority processing
STUDIO \$299/mo Team seats, full asset library	ENTERPRISE Custom 100,000+ scans, dedicated support

Per-scan API: **Mary \$0.50 Qualia \$1.00**

Forward plan, not current revenue: licensing the behavioral and neural-response dataset once a proprietary corpus is collected at scale.

Five tiers of signal. One of them is already the hardest thing to copy.

01

Behavioral signal

Eye movement, voice tone, dwell time — collected from every scan run today.

LIVE

02

Neural signal

EEG — brain electrical activity and timing.

IN PROGRESS

03

Synthesized fMRI — the core IP

Sapient-1 predicts whole-cortex fMRI activation from a stimulus, 20,484 vertices at 1 Hz, conditioned per subject. The per-subject head beats the average-brain model out of sample — *Cortex of One*, our strongest result and the thing a competitor cannot shortcut.

LIVE

04

Neural implant

Direct neural readout hardware.

ROADMAP

05

Neural decoding

fMRI-conditioned omnimodal generation.

RESEARCH

These are predicted activations, not measured fMRI. We withhold a construct score when the signal is confounded — that discipline is part of the product, not a caveat on it.

Nobody else models the whole brain, per person.

INDIVIDUAL-CONDITIONED

- Affectiva — single-modal facial affect
- Hume — voice-only emotion
- Inworld — vertical-specific persona layer
- **Sapient** — whole-cortex model, conditioned per subject

Built by people who evaluate brains for a living.

Aayush Gandhi

CO-FOUNDER & CTO

Leads the neuroscience program: the brain-encoding models (Mary, Qualia) behind Sapient-1, and the read-out validation layer that grounds every construct in cited neuroscience and withholds a score when the signal is confounded. AI-safety fellow (PRISM); background evaluating AI-driven models of the brain for statistical validity in emotional processing, neural encoding and decoding, and coercive manipulation.

Co-founder / CEO bio
— add here —

10 — THE ASK

Raising to turn the core model into an owned dataset.

\$2M pre-seed at a \$20M cap

MILESTONE A

Foundational model V1

Tier 3 — synthesized fMRI — at scale across subjects and stimulus types.

MILESTONE B

First proprietary dataset

Tiers 1 & 2 — behavioral and neural (EEG) signal — collected at volume.
